

The 90-Day TRU Alpha Pilot Framework

A structured pilot for multi-site fitness operators to prove member adoption, operational fit and commercial relevance before making a wider rollout decision.

- | | |
|----|--|
| 01 | Baseline
Document what is happening before the pilot. |
| 02 | Deploy
Run the journey in representative sites. |
| 03 | Measure
Track adoption, behaviour and operator feedback. |
| 04 | Decide
Use evidence to shape the rollout case. |

**Use this as a
working tool**

This document is a campaign concept. It is designed to structure a practical operator conversation and identify what should be tested before a wider investment decision.

Days 0-15: Design the pilot

Choose sites that tell you something useful, not only sites that are easiest to manage.

- Select 2-5 representative sites.
- Define the member cohort and use case at each site.
- Capture baseline PT, engagement and retention metrics where available.
- Agree roles for local teams and central support.
- Set the minimum evidence required for a rollout decision.

Days 16-30: Prepare and launch

Make the operating model consistent enough to compare sites.

- Train staff on the member journey and consultation.
- Set measurement capacity and booking / walk-up process.
- Launch agreed member communications.
- Create a consistent data-capture approach.
- Confirm issue escalation and support ownership.

Days 31-75: Run and measure

Prioritise adoption and behaviour signals before jumping to financial conclusions.

Area	Example measure	Why it matters
Adoption	First scans / eligible members	Shows whether the proposition is being used
Repeat behaviour	Repeat scan rate	Indicates whether the journey creates a reason to return
Coaching	Consultations / PT introductions	Shows whether measurement changes the member conversation

Area	Example measure	Why it matters
Experience	Member and staff feedback	Tests operational and perceived value
Commercial	Conversion / revenue / retention signals	Builds the eventual business case

Days 76-90: Evaluate and decide

Replace modelled assumptions with what the pilot actually observed.

- Compare pilot sites with their baseline.
- Compare sites or cohorts where the methodology allows it.
- Separate operational problems from proposition problems.
- Estimate rollout cost using real implementation effort.
- Document where the use case was strongest.
- Make a rollout, iterate or stop recommendation.

Decision principle

A successful pilot does not need every metric to improve. It needs enough credible evidence to show where TRU Alpha creates value, for whom, and under what operating conditions.
